1 Operating System

The pcengines APU boards run Debian. To create the Debian live installation USB, follow these instructions: <https://github.com/ssinyagin/pcengines-apu-debian-cd>

Note that you need a DB9 cable to connect to the serial port present on the board for installation. More details on the serial connector are provided here: <http://www.pcengines.ch/pdf/apu1.pdf>

2 Services

The services running on the board:

- Geonetworking
- utoepy
- SSH

3 Connectivity

Description on what the ports are used for. eth0 is the port furthest away from the power connector.

NIC:	Use:
eth0	Service
eth1	Simulink
eth2	Unused

4 IP

Details on static IP addresses not yet added.

5 Users

Service is performed through the root account, and the root password is "pcengines".
